

SENSORY CONNECTION FOR COMMUNICATION

Communication is complex multi process activity and is key to our daily lives. Children with developmental issues including Autistic Spectrum Disorder, ADHD, Dyslexia, Dyspraxia and Developmental Delay goes through a great deal of difficulty in delivering good communication and a large number of them are not able to cope. They tend to shut down and display multiple behaviours.

It is also observed that many children with adequate language abilities may have difficulty with communication and they display odd behaviours likes– self-talking, self stimulation and being self absorbed.

Such behaviour once left unattended with an appropriate techniques / methods, the child's difficulties and struggles compounds and shape a personality, which may not be in social norms.
